

a**b****c**

Post hoc. (a) Clock value of every human embryo pseudobulk, relative to oocytes; diamonds and bars are stage means with 95% bootstrap intervals. (b) The contributions of the 1,839 clock genes, ranked and accumulated, over the interval fixed before scoring. (c) The per-gene contribution of the human interval against the mouse two-cell window (GSE280522 control), for the genes with a non-zero contribution in both; the mouse-to-mouse comparison of Figure 3c gave $r = 0.74$. The cancellation reproduces; the genes that produce it do not.
